Sample Collection Form

To uniquely identify each sample, write an abbreviated cultivar (strain) name in the first column, then a letter prefix for the group in the second column, and the total number of plants for the group in the third column.

Example: We have three trays of Candy Kush, labeled 'A', 'B' and 'C'. Each tray has 12 plants. So, we write CK-A-12 in the first row, CK-B-12 in the second row, and CK-C-12 in the third row. Do this for all samples.

1. Place a leaf between the paper disc and plastic film.

2. Crush the leaf using a blunt object.

3. Discard remaining plant material (gently scrape the paper if necessary). Only keep what was absorbed into the paper disc.
